

# WE HAVE THE POWER: WE ARE THE CHANGE

## A Voyage to Sustainable Development

**RENEWABLE ENERGY**

Renewable energy is energy that is derived from natural resources that are replenished at a faster rate than they are consumed. Renewable energy sources include wind, solar, hydro, geothermal, and biomass. Renewable energy is a clean and sustainable source of power that can help reduce greenhouse gas emissions and combat climate change.

Renewable energy is becoming increasingly important as the world's population grows and demand for energy increases. It is a key component of a sustainable energy system that can meet the world's energy needs without harming the environment.

**THE UNITED NATIONS AND CLIMATE CHANGE**

The United Nations has been instrumental in addressing climate change through various international agreements and initiatives. The most significant of these is the Paris Agreement, which was adopted in 2015 and aims to limit global warming to well below 2°C above pre-industrial levels.

The United Nations also plays a key role in promoting sustainable development and reducing greenhouse gas emissions. It does this through its Sustainable Development Goals (SDGs), which include targets for clean energy, climate action, and sustainable consumption and production patterns.
